RE: Luminant Mining Company LLC (Luminant)
Monticello Thermo Mine, Permit No. 5G
Revision No. 36-Bonding Update

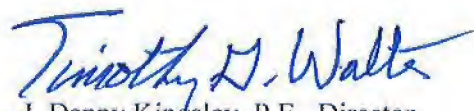

Dear Mr. Stroud:

Review of your request for the approval of Revision No. 36, submitted by letter dated July 26, 2018, is complete. A \$500 revision-application filing fee was included with the application. Revision No. 36 consists of a request for approval of an updated reclamation cost estimate and an associated bond map. Your application is considered complete and is accepted for filing.

I find that the application is not a significant revision to the approved reclamation plan at the Monticello Thermo Mine. The applicable requirements of §§12.71, 12.72, 12.142, and 12.145 have been met. Luminant's reclamation cost estimate of approximately \$17,791,518 is considered to be the minimum reclamation bond amount. The approved blanket bond in the amount of \$975,000,000 is adequate and no changes are required. The approved bond map (Plate 142-1, *Bond Map*, revised dated July 2018) is adequate. The proposed reclamation cost estimate and associated bond map are approved as submitted. The application is approved as submitted and Permit No. 5G revised accordingly.

A copy of Staff's review memorandum is enclosed. Should you have any questions, please do not hesitate to call me or Israr Anwar, Technical Coordinator for this application.

Sincerely,

for J. Denny Kingsley, P.E., Director
Surface Mining and Reclamation Division

MEMORANDUM

TO: J. Denny Kingsley, P.E., Director

THRU: Travis L. Wootton, Assistant Director
Timothy G. Walter, P.G., Manager, Applications and Permits *TBW*

FROM: Israr Anwar, P.E., Engineer

SUBJECT: Luminant Mining Company LLC (Luminant)
Monticello Thermo Mine, Permit No. 5G
Revision No. 36-Bonding Update

DATE: August 30, 2018

Luminant submitted Revision No. 36 by letter dated July 26, 2018. Revision No. 36 consists of a request for approval of an updated reclamation cost estimate and the associated bond map. A Form SMRD-2C and the \$500 revision-application filing fee were included with the initial application.

The following is a summary of Revision No. 36 and my technical review of the application.

PROPOSAL SUMMARY

Luminant indicates it provided an updated reclamation cost estimate and bond map to support the transfer of Luminant property to the City of Sulphur Springs and reflect recently approved release areas at the Monticello Thermo Mine.

The following information is a summary of the changes included in Revision No. 36:

Sections Revised	Title/Description of Changes
Miscellaneous	Form SMRD-2C
Section .142	Table 142-1, <i>Bond Map Summary</i> Plate 142-1, <i>Bond Map</i> , dated July 2018 Plate 142(a)-1, <i>Bond Change Map</i> , dated July 2018
Section .145	Appendix 145-H, <i>Reclamation Cost Analysis</i> , pages 145-H-1 through 17 and Appendix A, <i>Reclamation Cost Analysis, Equipment Productivity</i> , pages 145-H-A1 through A11

The proposed revision includes a request for removal of several undisturbed areas that are currently bonded at the mined or disturbed rate category, and updated Phase III release areas. Luminant's updated reclamation cost estimate in the amount of \$17,791,518, as indicated in Table I, *summary of Estimated Reclamation Costs*, (page 145-H-2).

TECHNICAL REVIEW SUMMARY

The revised reclamation cost estimate and associated bond map included in Revision No. 36 were reviewed as a revision to the approved reclamation plan at the Monticello Thermo Mine, Permit No. 5G.

The bond change map, Plate 142(a)-1, shows the proposed bond category change areas. The following table summarizes these changes:

Category Change	Proposed Acreage
Disturbed to No Bond (undisturbed)	416.0 acres
Mined to No Bond (Undisturbed)	91.7 acres
Disturbed to Phase III (Order dated March 20, 2018)	144.94 acres
Mined to Phase III (Order dated March 20, 2018)	166.47 acres
Disturbed to Phase III (Order dated April 25, 2005) *	46.7 acres

*portion of a Phase III bond release was rebonded to disturbed rate category in Revision No. 7 (approved by Order dated December 5, 2006), which is proposed to be reverting back to Phase III bond release.

The minimum required bond amount at the Monticello Thermo Mine is determined using a hybrid worst-case/area-bond method. Revision No. 36 includes Luminant's revised reclamation cost estimate of \$17,791,518, that incorporates the proposed changes. The approved reclamation cost estimate (Revision No. 28, approved administratively by letter dated February 1, 2017) is \$19,314,791. The proposed reclamation cost estimate has decreased primarily due to removal of undisturbed area from the bond and credit for additional Phase III bond release areas. The SMRD Inspection and Enforcement Staff verified (by e-mails dated August 24 and 28, 2018) that the areas are adequately bonded, including areas proposed for removal from the bond and a 46.7-acre area reverting back to Phase III release. The proposed bond map, Plate 142-1, contains accurate depictions of the bonded areas.

The amount of the bond proposed in this revision was reviewed for completeness, reflecting the probable difficulty of reclamation considering such factors as topography, geology, hydrology, and vegetation potential [§12.304(a)]. Calculated volumes appear to be accurate and consistent with past estimates. Equipment used in the estimate is consistent with equipment availability that could be utilized by a third-party contractor [§12.304(b)]. Luminant's reclamation cost estimate in the amount of \$17,791,518 should be considered the minimum required bond amount. The amount proposed is sufficient to assure the completion of the reclamation plan if the work must be performed by the Commission in the event of forfeiture. In no case is the bond for the entire area less than \$10,000.

Luminant currently has an approved blanket collateral bond for its Texas mines in the amount of \$975,000,000 (approved by Order dated September 27, 2016). The current minimum required reclamation bond amounts per mine are shown below. Luminant's collateral bond amount exceeds the sum of the estimated reclamation costs for its Texas mines by \$232,090,755. An increase to Luminant's collateral bond amount will not be required.

Mine Name	Permit Number	Reclamation Cost Estimate Date	Reclamation Cost Estimate
Big Brown Mine	3F	February 9, 2016	\$16,383,718
Martin Lake Mine	4L	February 28, 2017	\$120,349,023
Monticello Thermo Mine	5G	Pending Revision No. 36	\$17,791,518
Monticello Winfield Mine	34F	July 25, 2017	\$94,181,660
Oak Hill Mine	46C	July 5, 2017	\$149,439,526
Three Oaks Mine	48C	December 1, 2017	\$63,076,159
Bremond Mine	49B	October 25, 2016	\$3,423,560
Kosse Mine	50B	November 13, 2017	\$148,248,020
Leesburg Mine	51	May 3, 2016	\$4,886,759
Martin Lake AIV South Mine	53	June 6, 2014	\$40,448,786
Turlington Mine	54A	January 9, 2017	\$37,952,426
Monticello Thermo A-1 Area Mine	56	January 6, 2016	\$3,487,626
Liberty Mine	58	April 29, 2016	\$43,260,464
		Total Aggregate Reclamation Cost	\$742,909,245.00

Approved Collateral Bond \$975,000,000

Excess Bond Amount **232,090,755**

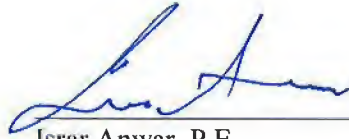

Based on the information provided, the approved bond amount is sufficient to cover the cost of reclamation and the requirements of §12.142(2)(C) and §12.145(b)(2) have been met.

Staff notes that an examination of the proposed changes to the cost estimate and bond map included in Revision No. 36 and the SMRD files indicates the following:

- a. No additional areas are proposed to be affected. Staff previously noted that no adverse impacts to private landowners are anticipated;
- b. No new protected cultural resource sites that will be affected;
- c. The approved probable hydrologic consequences (PHC) determination will not be affected;
- d. No operations are proposed within 300 feet of a public building, school, church, occupied dwelling, community or institutional building;
- e. No operations are proposed within 100 feet of a cemetery;
- f. No operations are proposed within 100 feet of a public road (as measured from the right of way) except as allowed in §12.71(a)(4); and
- g. No operations are proposed within or adjacent to lands within the boundaries of the National Park System, National Wildlife Refuge System, National System of Trails, National Wilderness Preservation System, or the Wild and Scenic Rivers System.

The requirements of §§12.71 and 12.72 have been met.

The proposed changes to the reclamation cost estimate and associated bond map do not appear to constitute a significant revision to the approved reclamation plan in Permit No. 5G in accordance with §12.226. The applicable requirements of §§12.71, 12.72, 12.142, and 12.145, and 12.226 have been met for the changes noted. Should you have any questions, please do not hesitate to call.

A handwritten signature in blue ink, appearing to read 'Israr Anwar', is written over a horizontal line.

All of the black and gray areas are undisturbed. The green shaded area consists primarily of the D03 Pond. This area is heavily vegetated and stable. Monty Ward is my contact at the mine and he believes he can find the BR that this pond was originally released under (2005 maybe?). It was re-bonded when they mined the G Area to the east because of run off from the adjacent haul road.

Bonding Update

Surface Mining Division

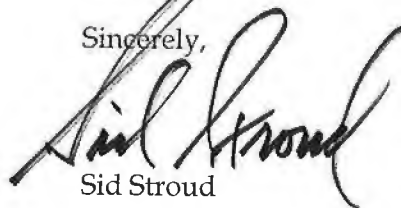

Dear Mr. Kingsley:

Luminant is transmitting with this letter three (3) copies of Revision Application No. 36 at the Monticello-Thermo Mine, Permit No. 5G. Revision Application No. 36 is seeking Commission approval to update the bonding information to support the transfer of Luminant property to the City of Sulphur Springs and to update the bonding information to reflect the recent approval of the 312.2-acre Phase III bond release package from reclamation obligations approved by Commission Order dated March 20, 2018.

Enclosed with this letter is the required permit application fee in accordance with Rule §12.108(a)(2) along with a completed SMRD-2C Form. Approval of Revision Application No. 36 is being respectfully requested from the Commission as soon as possible to facilitate the transfer of property.

Please contact Scott Mills at (214) 875-9090 if you have any questions.

Sincerely,

Sid Stroud

REVISION APPLICATION No. 36

July 26, 2018

INTRODUCTION

Revision Application No. 36 is being provided to the Commission seeking approval to revise and update the bonding information to support the transfer of Luminant property to the City of Sulphur Springs and to update the bonding information to reflect the recent approval of the 312.2-acre Phase III bond release package from reclamation obligations approved by Commission Order dated March 20, 2018.

The material contained within this document is fashioned similar to the approved permit application and where possible, revised and/or added material is labeled as "Revision No. 36" and should be replaced as noted in the Table of Contents of this document.

VERIFICATION OF APPLICATION

I, Scott Mills, Environmental Manager - Permitting, state that I have knowledge of the facts herein set forth, including those contained within the document titled Thermo Mine, Permit No. 5G, Revision Application No. 36, dated July 26, 2018, and that same are true and correct to the best of my information and belief.

Dated this 26th day of July, 2018.

APPENDIX 145-H
RECLAMATION COST ANALYSIS
LUMINANT MINING COMPANY LLC
MONTICELLO-THERMO MINE
PERMIT 5G REVISION NO. 36

This report is prepared to provide a basis by which the Railroad Commission may determine a performance bond amount in accordance with §§12.304 and 12.307 for the Thermo Mine. The equipment costs used in this estimate are from the "Cost Reference Guide for Construction Equipment," an annual publication produced by Dataquest, Inc. Costs are updated annually. Equipment selection and productivity were calculated using the "Caterpillar Performance Handbook, Edition 40."

The Thermo mine is comprised of eight mining areas (A through H). Mining in all areas has been completed except for the Area H. The mining operation utilizes auxiliary equipment for overburden removal. The Thermo Mine has four recoverable lignite seams. Overburden depth averages 40 feet to lignite. The interburden thickness between the three lower seams ranges between four and thirty feet. Luminant utilizes mixed overburden as a topsoil substitute.

Reclamation costs for the surface mining operation at this mine have been classified into five work activities: (1) worst-case pit closure, (2) disturbed area leveling, (3) soil preparation, (4) revegetation, and (5) maintenance. The costs associated with each work activity are summarized in Table VIII.

Mining operations have been segregated into four general disturbance categories:

1. Worst-Case Pit Areas: Pit 13, with a length of approximately 2,625 feet and an area of approximately 65 acres, will result in the highest cost of reclamation during the proposed permit term in Area H. The entire area of Area H is also included in the worst-case pit calculations.
2. Mined Area: Includes any area where spoil is deposited after lignite removal and mined areas returned to approximate original contour (AOC). Mined area bond is also applied to previously mined areas and the area ahead of the worst-case pit that is scheduled to be mined during the proposed permit term. The activities required on mined rate acreage are soil preparation, revegetation, and maintenance.
3. Disturbed Area: Includes construction activities at sediment ponds, diversions, access roads, haul roads, and facilities where topsoil is removed but the area is not mined. The activities required on disturbed rate areas are area leveling, final grading, soil preparation, revegetation, and maintenance.
4. Ancillary Area: Includes disturbance areas where soil preparation, revegetation, and maintenance are the only reclamation activities required.

The reclamation costs for these activities are determined by the selection and summation of the work categories required to reclaim the mining related disturbance. A summary of the total estimated reclamation cost is contained in Table I. The costs for reclamation of the worst-case pit are presented in Tables II & III. The costs for area specific reclamation activities are presented in Tables IV & V. The costs for disturbed area leveling are presented in Tables VI & VII. The per-acre revegetation costs associated with mined, disturbed, ancillary, Phase I and II areas are shown in Tables VIII. Equipment and material costs used in this report are presented in Appendix A. Note: accepted mathematical rounding to one decimal place was made after each step of computation.

Table I

Summary of Estimated Reclamation Costs

Administrative Cost 10%			\$ 1,617,410.70
Total Recommended Reclamation Bond			\$ 17,791,517.67

Worst Case Pit Closure Area: Includes any overburden spoil leveling required to complete the pit closure of areas scheduled to be mined by the dragline or auxiliary equipment.

Worst Case Pit Closure Backfilling & Grading: Includes any additional pit closure reclamation that could be present for an area scheduled to be mined with the dragline in the event a backfilling & grading variance is activated for the open pit.

¹- Mined Areas: Any area where spoil is deposited, and the active pit and highwall reduction areas.

Disturbed Areas: Includes construction activities at sediment ponds, diversions, access roads, haul roads, and facilities where topsoil is removed, but the area is not mined.

Ancillary Areas: Includes disturbance areas (where topsoil is not removed) on which soil preparation and seeding are the only required reclamation activities.

²-Acreage figures were taken from Plates 142-1 and 142-2 and Table 142-1 contained in the Permit No. 5G Revision No. 36.

Worst-Case Pit

The mine plan calls for the use of auxiliary equipment such as scrapers, end-dump trucks, excavators, and front-end loaders for all mining and reclamation activities. Based on information presented in the permit renewal application, the pit width is 200 feet with an angle of repose of 34 degrees. Reclamation cost estimates are based on the worst-case scenario for the final pit. Pit 13 in Area H (Block P-2) is the worst-case pit calculation. With an average (weighted) width of 2,625 feet, Block P-2 has a measured pit length of 2,625 feet. Six cross-sections of the worst-case pit are provided, with the length of the pit represented by each cross-section in Appendix B. The cross-sections (surveyed in Pit 56 in Area F) are representative of the worst-case pits. Using the noted pit length and average pit closure width, the worst-case pit-closure surface area is estimated at 65.39 acres.

Dozers will be required for worst-case pit closure. The productivities of a dozer for the various push distances involved have been calculated in Tables A-1 and A-2. A motor grader will be used for final grading of the pit area after leveling with the dozer. The motor grader will make two passes over the leveled material at a production rate of 0.5 hours per acre (Table A-4). A motor grader with a ripper bar, ripping to a depth of 1.3 feet, will be utilized to pre-condition the area prior to soil preparation and revegetation. It will be necessary for the motor grader with ripper to make one pass over the area with a production rate of 0.8 hours per acre (Table A-5). The number of hours required for these operations are listed in the following table.

**Table II-A
Area H Pit Closure**

Dozer Hour Required for Worst Case Scenario					
Cross Section ¹	Volume (bcy)	Volume ² (lcy)	Dozer Average Push ³ (ft)	Net Hourly Production ⁴ (lcy/hr)	Dozer Hours Required

Area H Worst-Case Pit/Back Filling & Grading Scenario

The mine plan calls for the use of auxiliary equipment such as scrapers, end-dump trucks, excavators, and front-end loaders for all mining and reclamation activities. Based on information presented in the permit renewal application, the pit width is 200 feet with an angle of repose of 34 degrees. Approximately, 797 feet of the 1,440 feet Backfilling & Grading distance of Area H lies outside the boundary of the Area H worst-case pit (Block P-2). The area created by the backfilling & grading distance outside of the Area H worst-case pit (Block WB&G-2) has a calculated area of 52.20 acres. Block WB&G-2 will be bonded at the mined rate.

Block WB&G-2 has a southern boundary that starts at the north of the Area H worst case pit block and a northern boundary approximately 1,440 feet from the high wall coal edge of Pit 13 (the basis of the Area H worst case pit), which creates an area of approximately 52.20 acres. Since the reclamation of block WB&G-2 will occur in conjunction with the Area H worst-case pit reclamation, a ratio between the surface area of the Area H worst-case pit (65.39 acres) and the dozer hours required to reclaim the aforementioned pit (2,393 hours) was used to calculate the dozer hours to reclaim the area within the WB&G-1 bond block. Once the aforementioned ratio (36.6 hr/ac) was applied to the WB&G-2 bond block, a required dozer hour calculation of 1,911 was produced. The results of the hours and cost to reclaim Block WB&G-2 are shown in the following tables.

Table III-A

Area H Overburden Stockpile Material Reclamation Cost

During the mining of Area H, approximately 2,300,000 lcy of material will be placed in an overburden stockpile (See Plate 139-1-5). After completion of mining in Auxiliary Area H, Luminant will begin to haul the aforementioned material from the stockpile to the final pit. This will be accomplished with loaders and end-dump trucks. The aforementioned reclamation equipment will haul overburden material to the stockpile area an average distance of 2,600 feet. The following equipment productivities have been generated to calculate the time required to transport the required suitable material.

1. Overburden Stockpile

- Loader Hours = $2,300,000 \text{ lcy} / 641 \text{ lcy/hr} = 3,589$
- Dump Truck Hours = $2,300,000 \text{ lcy} / 252 \text{ lcy/hr} = 9,127$

The parameters of the above equipment productivities can be found in Tables A-7 and A-8.

The following table displays the calculated cost for the transport of the overburden material.

Table V-A

Area H Overburden Spoil Stockpile Reclamation Costs			
Hours	Equipment	Cost/hr	Total Cost
3589	988H Loader Hours	\$165	\$ 592,185
9127	773E Dump Truck Hours	\$149	\$ 1,359,923
1522	Water Truck	\$148	\$ 225,256
1522	14M Grader	\$102	\$ 155,244
Total		\$	2,332,608

Area H Suitable Material Stockpile Reclamation Cost

In order to ensure adequate material is available to establish the top four feet of reclamation in Auxiliary Area H, Luminant will establish a 318,000 lcy and a 140,000 lcy stockpile (See Plate 139-1-5). Delivery of this material will be accomplished with loaders and end-dump trucks. The aforementioned reclamation equipment will haul suitable material to the stockpile an average haul distance of 2,600 feet. The following equipment productivities have been generated to calculate the time required to transport the required suitable material.

1. Suitable Material Stockpile

- Loader Hours = 318,000 lcy / 641 lcy/hr = 497
- Dump Truck Hours = 318,000 lcy / 252 lcy/hr = 1,262

2. Suitable Material Stockpile

- Loader Hours = 140,000 lcy / 641 lcy/hr = 219
- Dump Truck Hours = 140,000 lcy / 252 lcy/hr = 556

The parameters of the above equipment productivities can be found in Tables A-7 and A-8.

The following table displays the calculated cost for the transport of the suitable material.

Table V-B

Area H Suitable Material Stockpile Reclamation Costs			
Hours	Equipment	Cost/hr	Total Cost
716	988H Loader Hours	\$165	\$ 118,140
1818	773E Dump Truck Hours	\$149	\$ 270,882
303	Water Truck	\$148	\$ 44,844
303	14M Grader	\$102	\$ 30,906
Total		\$	464,772

Disturbed Area Leveling

All activities which disturb land in support of mining operations will require reclamation. These disturbed areas include sedimentation ponds, diversions, and roads. The volume of material per acre that will be required to reclaim these areas is as follows:

Sediment Pond Reclamation	
Pond	Volume (ac-ft)
ALMP Sump Mod No. 1	2.1
F-01 Pond	76.8

and a 10% increase to address future structures submitted between calculation updates.

	Structure Buffer Distribution	
Diversions	5,756.0	feet
Haul Roads	12,135.0	feet
Access Roads	11,513.0	feet
Ponds	79.9	ac-ft
MFD's	8,750.0	feet

Scraper productivity is calculated at 280 lcy per hour (Table A-3). After soil placement with scrapers, a dozer will be required for leveling. A dozer will also be required to assist in loading the scrapers at the rate of 1 dozer hour for each 3 scraper hours. An 8,000 gallon water tanker will be used to suppress dust generated by the scrapers at the rate of 1 tanker hour for each 6 scraper hours.

Table VII-A

Scraper Hours For Dist. Area Leveling

0.6	1	0.6

Hours based on productivity factor calculated in Table A-5

Soil Preparation and Revegetation

Luminant proposes the following composite postmine land uses for the Monticello-Thermo mine to be revegetated as follows:

Land Use (Permit Term)	L/U %	Native Grass	Bermuda	Trees
Pastureland (100% bermudagrass, 12.5% trees)	59.5%	0.0%	52.1%	7.4%
Fish & Wildlife (trees and shrubs)	18.5%	9.3%	0.0%	9.3%
Forestry	13.8%	0.0%	0.0%	13.8%
Developed water resources	8.1%	0.0%	0.0%	0.0%
Industrial/Commercial	0.0%	0.0%	0.0%	0.0%
Cropland	0.0%	0.0%	0.0%	0.0%
Grazingland (87.5% native grass, 12.5% trees)	0.0%	0.0%	0.0%	0.0%
Undeveloped (50% trees, 50% native gr)	0.0%	0.0%	0.0%	0.0%
	99.9%	9.3%	52.1%	30.5%

The fertilizer rates that will be used are as follows:

Initial application to all areas	=	288 lb/ac of 18-18-18
Annual application to pastureland	=	288 lb/ac of 18-18-18
Annual application to native grass areas	=	244 lb/ac of 19-19-19

For purposes of estimating revegetation costs, it will be assumed that the entire acreage will receive the same soil preparation prior to seeding or sprigging. Species will be machine and/or hand planted.

Temporary cover crops (wheat and millet) will be planted on 50.0% of the total area to be revegetated to prevent excessive erosion prior to establishing a permanent cover as follows:

Area Planted to Wheat	23.3%
Area Planted to Millet	23.3%

Since weather conditions at certain times of the year are not conducive to planting and establishment of temporary cover crops, it is assumed that 50% of the area to be revegetated will receive a mulch treatment at the rate of two tons per acre, anchored with a mulch crimper. Areas with temporary vegetation will be planted to permanent vegetation at the next available opportunity according to the season.

All pastureland areas will be planted to bermudagrass. As indicated, woody vegetation will then be planted on approximately 12.5% of the pastureland. Since planting of trees will occur within established pastureland areas, the sum of the vegetation types exceeds the portion of the area to be revegetated. Clover seed will be broadcast in pastureland areas during the fall. Fish and wildlife habitat areas will be comprised of half woody vegetation and half planted to native grasses. Forestry areas will be planted to all trees. Residential areas will be planted to bermudagrass. Developed water resources and industrial/commercial will not be revegetated.

Half of the undeveloped areas will also be planted to native grasses and half to trees. It is estimated that as much as 20% of the acreage may need to be replanted. A planting factor of 1.2 is used to account for the replanted acreage. Areas planted to bermudagrass will be fertilized and mowed once yearly during a five-year extended responsibility (ERP) period. Areas planted to native grass species will be fertilized for the first three years only and mowed twice during a five-year ERP period. Areas planted to trees will be fertilized for the first year only. It is estimated that weed control will be practiced on three occasions during a five-year ERP period.

The permittee is required to maintain the revegetated areas for a minimum of five years in the ERP. Soil tests (23-acre grids) will be conducted to identify AFM/TFM in compliance with the Regulations. Additionally, the results of the soil analyses to determine fertility needs for four years of the ERP will also be provided to the Commission. Grids of 23 acres are used to approximate the soil testing grids of 1000 ft x 1000 ft.

TABLE VIII-A

SUMMARY OF RECLAMATION COST

WORK CATEGORY	EQUIPMENT	UNITS	COST/UNIT	\$/ ACRE
DISTURBED AREA LEVELING				
	631G Scraper	65.5 hrs/ac	\$207 /hr	\$13,559
	D-9R	21.8 hrs/ac	\$188 /hr	\$4,098
	8,000 gal. Water Truck	10.9 hrs/ac	\$148 /hr	\$1,613
			SUBTOTAL	\$19,270
FINAL GRADING				
	14M Motor Grader	0.6 hrs/ac	\$102 /hr	\$61
	14M Motor Grader w/ Ripper	0.6 hrs/ac	\$109 /hr	\$65
			SUBTOTAL	\$127
SOIL PREPARATION				
	Revegetated Areas Percentage	91.9%		
	Initial Fertilizer Application to all Areas	288 lb/ac		
	Fertilizer Cost		\$0.31 /lb	\$82
	Number of Fertilizer Applications	1		
	Fertilizer Application Cost		\$4 /ac/appl	\$4
	Percentage of the Area Limed	91.9%		
	Lime Application, all areas	5 tons/ac		
	Lime Cost		\$23 /ton	\$106
	Offset Disk to Incorporate Lime	0.5 hrs/ac		
	Offset Disk Cost		\$60 /hr	\$28
	Tandem Disk for Final Seedbed Preparation	0.5 hrs/ac		
	Tandem Disk Cost		\$60 /hr	\$28
			SUBTOTAL	\$247
REVEGETATION				
	Percentage of Area to be Soil Tested	91.9%		
Initial Soil Tests	Initial Soil Test (\$252 /5.7ac grid)		\$252 /acre	\$40
	Grids/Acre	0.174		

Temporary Cover Crop in all Areas

Percentage of Revegetated Area Planted to Cover Crop (cool season)	23.0%		
Cover Crop Cost (wheat)		\$13	\$3
Tractor w/ Grain Drill for Cover Crop		\$18	\$4
Percentage of Revegetated Area Planted to Cover Crop (warm season)	23.0%		
Cover Crop Cost (millet)		\$26 /ac	\$6
Tractor w/ Grain Drill for Cover Crop		\$18 /ac	\$4
Percentage of Area for Temporary Cover Crop	45.9%		
Mulch and Tack Cost		\$200 /ac	\$92

Permanent Crop (Bermuda)

Revegetated Area w/Bermuda and Clover	59.5%		
Planting Factor	1.2		
Native Grass Mix		\$24 /ac	\$17
Tractor w/ Grain Drill Cost		\$18 /ac	\$2
Number of Mowings	1		
Mowing Cost		\$18 /ac	\$11
Clover Crop Cost		\$9 /ac/appl	\$5

Permanent Crop (native grass mix)

Percentage of Postmine Area Drilled	9.3%		
Planting Factor	1.2		
Native Grass Mix		\$65 /ac	\$7
Tractor w/ Grain Drill Cost		\$18 /ac	\$2

Permanent Trees and Shrubs

Percentage of Postmine Area to Trees and Shrubs	30.5%		
Planting Factor	1.2		
Trees and Shrubs Cost		\$85 /ac	\$31

SUBTOTAL	\$243
-----------------	--------------

MAINTENANCE 2nd thru 5th years**All Areas**

Postmine Revegetated Area Percentage	91.9%		
Soil Test 4th Year of ERP (random 10% of 5.7-ac grids)		\$25 /grid	\$4
Grids/Acre	0.174		
Soil Test - Last Four Years of Liability Period (23-ac grid)		\$72 /grid	\$3
Grids/Acre	0.044		
Number of Weed Control Applications	3		
Chemical Weed Control Cost		\$10 /ac	\$28

Permanent Crop (Burmuda)

Percentage of Postmine Area Drilled	59.5%
-------------------------------------	-------

Annual Fertilizer Application	288	lbs/ac		
Fertilizer Cost			\$0.31 /lb	\$212
Number of Fertilizer Applications	4

TABLE A-5

SUBSOIL AND TOPSOIL REPLACEMENT

Productivity of Grader w/ Ripper

Earthmoving Activity - Scarify subsoil prior to placement of topsoil

Characterization of Equipment Used: Caterpillar 14M Grader w/ripper

Ripping Depth	1.3	ft
Width per pass	8.5	ft
Average Speed	2.7	mph
Operator Factor	0.8	
Job Efficiency Factor	0.83	(50 min/hr)
Weather Factor	1.1	

Assume 1 pass over all areas prior to topsoiling or soil preparation.

Adj. Grader Productivity = (Sq. ft./ac x Weather Factor)
/ (Job Eff. Factor x Op. Factor x Width/pass x Feet/mile x Speed)

Sq. Ft. per acre	Weather Factor	Job Eff. Factor	Operator Factor	Width per Pass (ft)	Feet per Mile	Average Speed (mph)	Adjusted Grader Productivity (hr/ac)
43,560	1.1	0.83	0.8	8.5	5,280	2.7	0.6

TABLE A-6

FINAL GRADING
Productivity of Dozer

Earthmoving Activity - Final Leveling Mined Areas

Equipment Used: Caterpillar D9T w/U-blade

Final Grading Mined Acres.

Effective blade width	15	feet
Forward speed	2.4	mph
Reverse speed	5.2	mph
Operator Factor	0.8	
Job Efficiency Factor	0.83	(50 min/hr)
Weather Factor	1.1	

Forward Dozer Prod. = (sf/ac) x (job eff. factor) x (weather factor)
 /(op. factor x blade width x feet/mile x
 speed)

Sq. Ft. per acre	Job Efficiency Factor	Weather Factor	Operator Factor	Blade Width (ft)	Feet per Mile	Average Speed (mph)	Adjusted Dozer Productivity (hr/ac)
43,560	0.83	1.1	0.8	15	5,280	2.4	0.3
43,560	0.83	1.1	0.8	15	5,280	5.2	0.1
						Total	0.4

TABLE A-7

**PRODUCTIVITY FOR LOADER USE FOR
THE G-AREA, F-AREA & H-AREA RECLAMATION ACTIVITIES**

Productivity of Loader

Earthmoving Activity - Loading material from stockpile

Equipment Used: Caterpillar 988H FEL

Bucket Size	8.5	lcy
Bucket Fill Factor	1.0	
Job Efficiency Factor	0.83	(50 min/hr)
Weather Factor	1.1	
Average cycle Time	0.6	min
Adjusted Bucket Capacity	8.5	lcy

Adjusted Hourly Production = Adj. Bucket Capac. x Job Effic. Factor x 60
min/hr

/ (Ave. Cycle Time x Weather Allowance)

Adjusted Bucket Capacity (lcy)	Job Efficiency Factor	Average Cycle Time (min)	Weather Factor	Adjusted Hourly Production (lcy/hr)
